(h) Claims.

I claim:

1. A signaling apparatus comprising a photosensitive means, a controller, and a signaling means; said controller being responsive to variations in light intensity as communicated to it by said photosensitive means; said controller having a memory capable of storing data; said controller using data from said memory to actuate said signaling means in response to specified conditions of light intensity.

2. The signaling apparatus of claim 1 having a means to control the amplitude of the signaling means.

3. The signaling apparatus of claim 1 having a means for quantifying luminosity, said controller using data from said memory to actuate said signaling means only in response to sensation of specified quantities of lumens.

4. The signaling apparatus of claim 1 having a means for placing data into said memory.

5. The signaling apparatus of claim 1 further comprising a transceiver capable of sending and receiving a signal through telecommunication lines.

6. The signaling apparatus of claim 1 wherein said signaling means is a transceiver capable of sending and receiving a wireless signal.

7. The signaling apparatus of claim 1 further comprising a timing means; said controller being responsive to variations in time as communicated to it by said timing means; said controller using data from said memory to actuate said signaling means in

response to specified conditions of time.

8. A signaling apparatus comprising a photosensitive means, a timing means, a controller, and a signaling means; said controller being responsive to variations in light intensity as communicated to it by said photosensitive means; said controller being responsive to variations in time as communicated to it by said timing means; said controller having a memory capable of storing data; said controller using data from said memory to actuate said signaling means in response to specified conditions of light intensity.

9. The signaling apparatus of claim 8 having a means to control the amplitude of said signaling means.

10. The signaling apparatus of claim 8 having a means for quantifying luminosity, said controller using data from said memory to actuate said signaling means only in response to sensation of specified quantities of lumens.

11. The signaling apparatus of claim 8 having a means for placing data into said memory.

12. The signaling apparatus of claim 8 further comprising said controller using data from said memory to actuate said signaling means in response to specified conditions of time.

13. The signaling apparatus of claim 8 wherein said signaling means is a transmitter capable of sending a wireless signal.

14. The signaling apparatus of claim 8 further comprising a transceiver capable of sending and receiving a signal through telecommunication lines.

15. A remote signaling apparatus comprising a timing means, a

controller, and a wireless transmission means; said controller being responsive to variations in time as communicated to it by said timing means; said controller having a memory capable of storing data; said controller using data from said memory to actuate said wireless transmission means in response to specified conditions of time; said wireless transmission means sending a signal defined by data from said memory; said signal being receivable by a specified electronic device carried by the person being signaled.

16. The remote signaling apparatus of claim 14 having a means to specify said specified electronic device.

17. The remote signaling apparatus of claim 14 having a means for displaying the data from said memory.

18. The remote signaling apparatus of claim 14 having a means for placing data into said memory.

19. The remote signaling apparatus of claim 14 further comprising a photosensitive means; said controller being responsive to variations in light intensity as communicated to it by said photosensitive means; said controller using data from said memory to actuate said signaling means in response to specified conditions of light intensity.

20. The remote signaling apparatus of claim 14 having a speaker and said controller can send auditory signals from said speaker; said auditory signals being defined by data from said memory.
